1. Executive Summary & Core Premise

Modern digital ad auctions (Meta Andromeda, Google Performance Max) operate on high-dimensional vector retrieval systems rather than legacy manual bidding. This whitepaper documents the 3-Tier Dynamic Spend Vector (DSV) framework engineered by Aqib Ramzan, which has successfully scaled e-commerce DTC ad accounts from \$50k/month to over \$1.24M/month while maintaining a target Marketing Efficiency Ratio (MER) above 4.0x and reducing Meta Customer Acquisition Cost (CAC) by 38%.

2. Empirical Performance Benchmarks (\$1M+ Managed Spend)

- Monthly Revenue: \$50,000 -> \$1,240,000 (+2,380.0%)
- Blended MER / ROAS: 1.8x -> 4.2x (+133.3%)
- Meta Ad CAC: \$64.50 -> \$39.99 (-38.0%)
- PMax Conversion Rate: 2.10% -> 4.85% (+130.9%)
- Total Tracked Managed Spend: \$1,000,000+ (\$1M+)

3. The 3-Tier Dynamic Spend Vector Allocation

1. Prospecting Vector (70% Budget Allocation): Dynamic creative testing leveraging 12+ multi-format asset pods and broad intent targeting aligned with Meta Andromeda.
2. Middle-of-Funnel Retargeting (20% Budget Allocation): Omnichannel social proof loops across Meta, TikTok, and YouTube Shorts.
3. Retention Layer (10% Budget Allocation): Post-purchase dynamic upsell ads integrated with zero-party data.
